

MindEase 2.0

HackMatrix 2026 - Round 2 | Project Documentation

Your Daily Mental Fitness Companion

Team Name	Team HackMatrix
Team Leader	Atharv Kulshrestha
Team Members	Atharv Kulshrestha, Avika Tanwar
Problem Statement	PS-XX
Event	HackMatrix 2026 - Round 2
Project	MindEase 2.0
Domain	Healthcare / Mental Wellness

1. Project Summary

MindEase 2.0 is an AI-powered mental wellness platform designed to transform emotional well-being into a daily habit rather than a crisis response. It combines a context-aware AI companion, mood tracking, private journaling, calming activities, music therapy, and insights in one platform. The product is designed for students and young professionals who need a private and accessible way to understand their emotions and build healthier daily habits.

2. Problem Being Solved

- Students and young professionals experience daily stress, anxiety, academic pressure, work pressure, and emotional overload.
- Many mental wellness platforms focus primarily on crisis intervention rather than everyday emotional well-being.
- Wellness activities are often fragmented across separate applications for journaling, mood tracking, meditation, music, and support.
- Users may lack a simple way to understand their emotional patterns and identify which activities are useful for them.
- This fragmentation can reduce consistency and long-term engagement.

3. Why This Problem Exists

- Mental wellness is often treated as something to address after a problem becomes serious.
- Daily emotional check-ins are not consistently integrated into everyday routines.
- Users have to switch between multiple tools for reflection, relaxation, tracking, and support.
- Personalization is limited when wellness tools do not maintain useful context about a user's habits and goals.
- Privacy concerns can also discourage people from sharing sensitive emotional information with online services.

4. Solution Overview

MindEase turns mental wellness into a repeatable daily workflow. Users can check their mood, reflect through journaling, use calming activities, listen to wellness-oriented audio, talk with the AI companion, and review insights.

The system is designed to connect these interactions so users can build awareness and healthier habits over time.

Core workflow: Mood Check-in → Reflection → Wellness Activity → Insights → Personalized Guidance

5. Unique Selling Point

MindEase focuses on daily mental fitness rather than waiting for a user to reach a crisis point. Its USP is the integration of emotional check-ins, reflection, wellness activities, AI guidance, and longitudinal insights into one privacy-first experience. The product is designed around habit formation and continuous self-awareness.

6. Key Features

Feature	What it provides
Context-aware AI Companion	Conversational support using user context, wellness goals and available mood/journal information, with re
Mood Tracking	Daily check-ins, streaks, weekly charts, and trend-based mood prediction.
Private Journal	Guided prompts, cognitive-reframing suggestions, and voice dictation through the Web Speech API.
Calming Activities	Breathing, meditation, grounding, and focus timer experiences.
Music Therapy	Relaxation and focus-oriented audio experiences.
Habit Garden	A visual habit-building element that grows as users maintain wellness habits.
Insights & Data Explorer	Mood and wellness insights with WHO/IHME mental-health datasets and visualizations.
Privacy & Offline Use	Browser-local data storage, no cloud account data collection in the current privacy-first model, and PWA o

7. Technology Stack

Layer	Technology
Frontend	React, Vite, JavaScript, Tailwind CSS v4, Framer Motion
Routing	React Router v7
AI Companion	OpenAI-compatible Chat Completions API, Groq Llama 3.3 default, Gemini fallback, offline mock mode
Voice Input	Web Speech API
Data Visualization	Recharts
Offline / PWA	Vite PWA, Workbox service worker
Data Layer	Browser localStorage
Authentication	React Context API, SHA-256 hashed demo credentials
Data Science	Python, Jupyter Notebook, pandas for EDA and prediction experiments

8. Current Platform Implementation

- React + Vite web application deployed on Netlify.
- Mood tracking and dashboard workflows.
- Journal experience with guided reflection functionality.
- AI Companion interface with configurable AI providers and offline fallback.
- Breathing, meditation, grounding, and focus experiences.

- Music and relaxation experience.
- Habit garden and wellness streak concepts.
- Insights and visualizations using Recharts.
- WHO/IHME research datasets included in the Data Explorer.
- Browser-local data persistence and PWA offline capability.

9. Platform Preview

Live Demonstration: <https://mindease-hackmatrix2026.netlify.app>

The deployed platform can be accessed directly through a browser. The project is designed to work offline as a Progressive Web App, while optional real AI responses can be enabled through supported API keys.

11. Future Scope

- Expand AI personalization using longer-term behavioral and wellness context.
- Improve mood prediction and activity-effectiveness analysis.
- Conduct structured user testing and reliability evaluation.
- Strengthen privacy and security controls for future deployments.
- Explore a scalable backend and managed data services where appropriate.
- Pilot the platform with student communities and universities.
- Add community and smart-notification capabilities.
- Expand the platform to additional wellness domains and user groups.

12. Team

Member	Role
Atharv Kulshrestha	Project Lead, Frontend, UI/UX, AI Integration
Avika Tanwar	Frontend Designer, CSE 2nd Year

13. Achievements

- Winner, HACKMoR 2026, Manav Rachna University.
- Grand Finale selection, Technology Business Idea Pitch (Tech-BIP), EDII Ahmedabad.

14. How to Explain MindEase in a Pitch

Problem: People often use mental wellness tools only when they are already overwhelmed, while everyday wellness is fragmented across multiple applications.

Solution: MindEase brings daily mood check-ins, reflection, calming activities, AI guidance, music, and insights into one privacy-first platform.

USP: MindEase treats mental wellness as a daily habit and connects user activity with ongoing emotional awareness rather than functioning only as a crisis-response tool.

Technical strength: The platform combines a modern React frontend, configurable AI providers, offline PWA support, local-first storage, voice input, data visualization, and research datasets.

Future: The next stage is deeper personalization, stronger analytics, structured user testing, and real-world student or university pilots.

"Mental wellness isn't a destination. It's a habit."
